Active scenario in this snapshot: BASE. FMB publishes a re-valued bear and bull fair value only for a sum-of-the-parts issuer; for other methods the scenario inputs above and the sensitivity grid (next pages) are what it publishes, and no bear or bull value is invented here.

Relative value

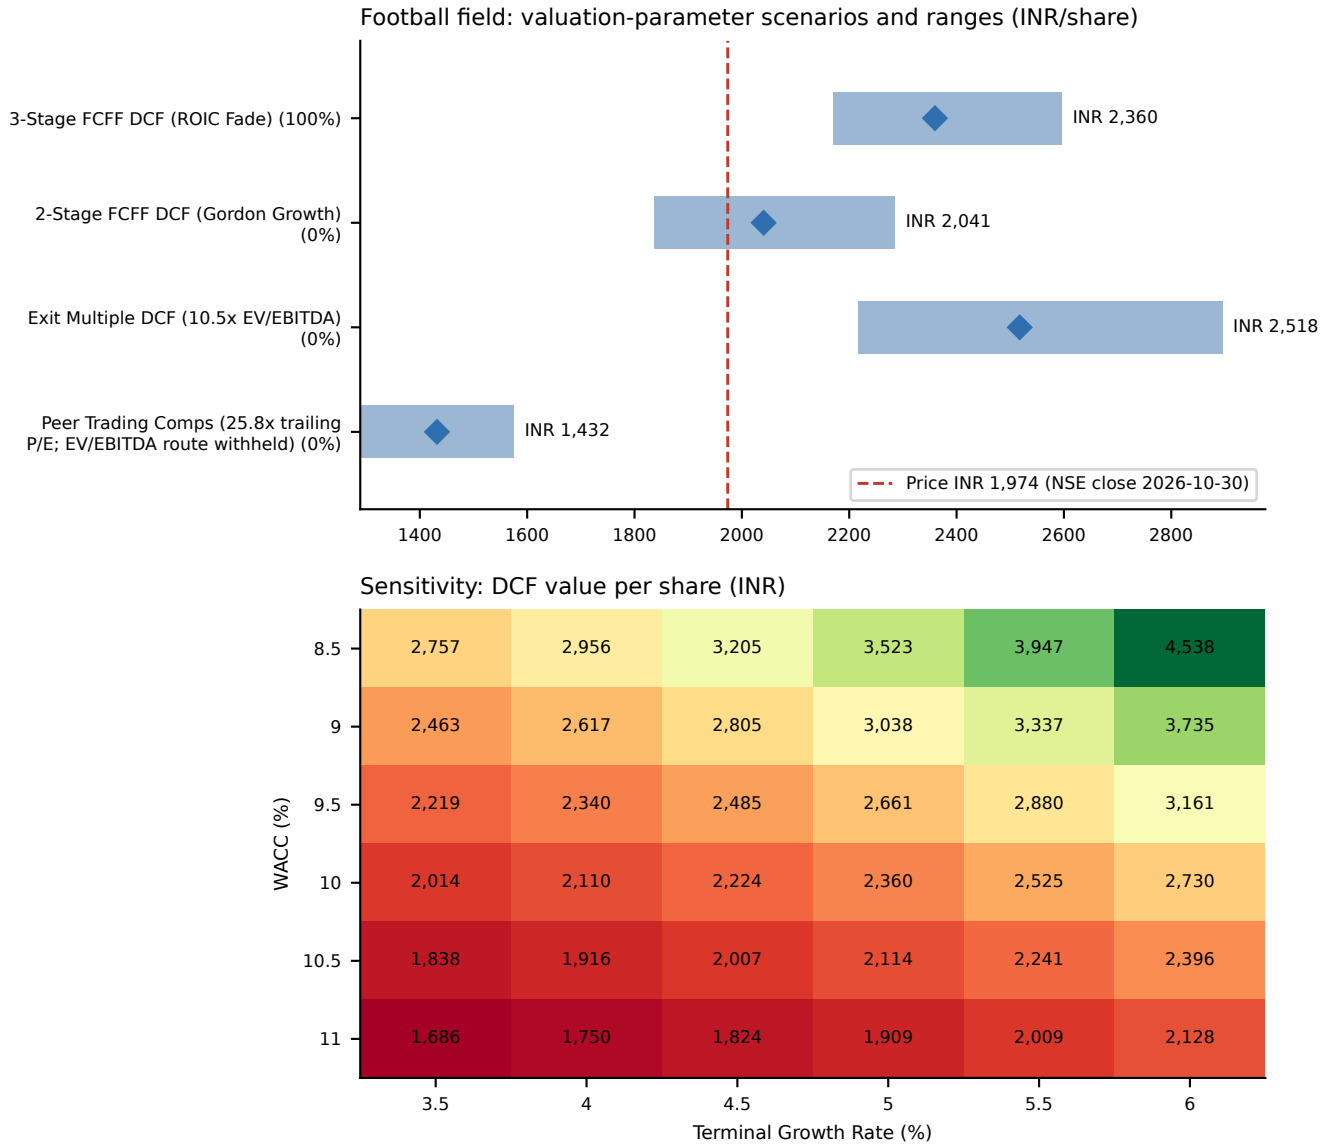

Trading comparables imply INR 1,431.96 per share (a cross-check, not the primary value).

Reverse valuation: what the price implies

Measure	Value
Market price (INR)	1,973.70
Implied 10-year revenue growth (CAGR)	15.40%
Model base-case revenue growth (CAGR)	14.88%
Expectation gap (basis points)	52
Implied terminal ROIC	30.74%
Discount rate / terminal growth	10.00% / 5.00%
Verdict	BALANCED REALISTIC EXPECTATIONS

At 1973.70 (NSE official close (UDiFF bhavcopy) + Screener.in structured dataset, as of 2026-10-30) the market prices in a 10-year FCFF growth rate of 15.40% against a bottom-up fundamental base case of 14.88%, a gap of +52 bps. Discounted at 10.00% with 5.00% perpetual growth (mid-year convention). This describes market EXPECTATIONS, not fair value.

Distribution of simulated value

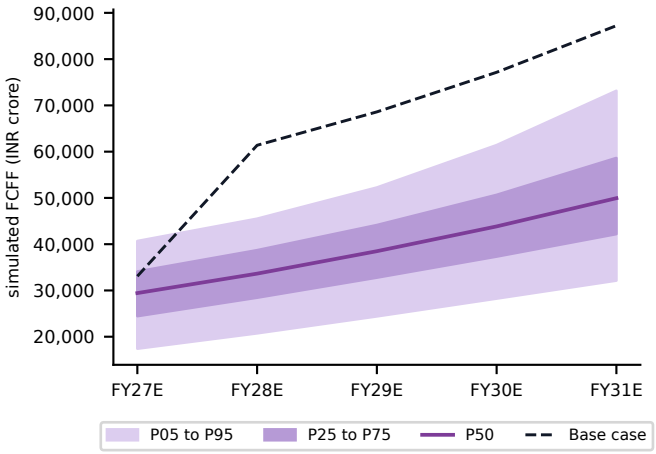

Cumulative distribution

Tornado: which driver moves the value

Fan: simulated free cash flow to firm

The tornado ranks drivers by squared correlation with the simulated value; with correlated drivers it ranks influence, it does not partition variance.

Thresholds and how each is labelled

Threshold	Value	Kind	Meaning
convergence.p50DriftPct	1	POLICY	max split-half drift of the median for `converged`; a reviewer rule, not a confidence guarantee
convergence.p05p95DriftPct	2.5	POLICY	max split-half drift of P05 and P95 for `converged`
convergence.minValidDraws	200	POLICY	fewer valid draws than this is never called converged
wacc.spreadStdDev	0.008	POLICY	80 bp discount-rate spread; not estimated from data
capex.spreadStdDev	0.005	POLICY	0.5 point of revenue capex-intensity spread; not estimated from data
growth.stdDevClamp	[0.015, 0.06]	POLICY	reported growth spread is clamped into this band
margin.stdDevClamp	[0.01, 0.05]	POLICY	reported EBIT-margin spread is clamped into this band
draw.rejectWaccWithin	0.005	STRUCTURAL	a draw with WACC less than terminal growth + 0.5 pt is impossible (Gordon growth) and is rejected, counted and reported
draw.rejectMarginAtOrBelow	0.01	POLICY	a draw with EBIT margin at or below 1% is rejected

Threshold	Value	Kind	Meaning
draw.growthBounds	[-0.4, 0.6]	POLICY	draws outside these growth rates are rejected
draw.rejectNonPositivePrice	0	STRUCTURAL	a non-finite or non-positive simulated share price is rejected (limited liability)
correlation.growthMargin	0.35	POLICY	operating-leverage assumption used because fewer than 4 paired reported years exist
correlation.growthCapex	0.5	POLICY	growth must be funded; not measured
correlation.wacc	0	POLICY	discount rate drawn independent of operating drivers; not measured

POLICY = a reviewer's rule, not a statistical guarantee; STRUCTURAL = a mathematical requirement; MEASURED = estimated from this issuer's filings. Highlighted rows are policy.

Calibration: what this does and does not establish

- growth~margin POLICY 0.35 (operating leverage): fewer than 4 paired reported years
- growth~capex correlation is a POLICY value (0.5), not measured
- WACC is drawn independent of the operating drivers (POLICY 0)
- Driver spreads come from at most a few reported years; tails beyond the history are extrapolation
- Walk-forward check on 63 recorded NSE issuers (2026-10-07): the next reported year fell inside the engine's 90% growth band 52% of the time and its margin band 70% of the time, so the input spreads UNDER-STATE year-ahead variation (backend/services/mc_calibration_backtest.py)
- No valuation backtest exists: archived model vintages are days old, so none has a realised outcome
- contributionToVariance is a squared-correlation split; with correlated drivers it ranks influence, it does not partition variance
- Equity bridge taken from the published FCFF DCF (net debt and adjustments 146134): the FY26 balance sheet does not split short-term borrowings, long-term debt.
